Job Application Tracker

Automated hiring pipeline | n8n · Google Sheets · Gmail

The challenge

Every application has to be logged, acknowledged, passed to HR and sorted by experience before the right reply is sent. Done manually, this is slow and inconsistent, and applicants are left waiting.

The setup

How it works

- Capture: a new application starts the workflow. Applications already processed are skipped, so nobody is emailed twice.
- Record and respond: the applicant is saved to an All Applicants sheet, receives an instant confirmation, and HR is alerted.
- Sort: a rules-based switch groups applicants by experience: Junior (0–2 years), Mid-level (3–5 years) or Senior (6+ years).
- Follow up: each group is saved to its own sheet. Junior applicants receive a kept-on-file email; others receive an interview invitation.

Result

Tested with one applicant per experience level, then run live during the presentation at TS Academy. Every applicant was recorded, emailed and filed to the correct sheet with no manual steps.

BUSINESS VALUE

- **Instant replies.** Every applicant hears back in seconds, protecting the employer's reputation.
- **Time saved.** HR no longer copies details between forms, sheets and inboxes.
- **Faster hiring.** Strong candidates reach interview sooner, before competitors contact them.

ALSO WORKS FOR SALES

The same workflow can handle sales leads and quote requests: an instant confirmation, a sales-team alert, and sorting by budget, service or location, so the best leads are followed up first.

Customer Feedback Automation

AI-powered feedback routing | Make · OpenAI · Google Sheets · Airtable · Gmail

The challenge

A car care chain with four branches receives more feedback than it can review quickly. Urgent complaints are delayed, good reviews go unused, and managers have no single view of each branch.

The setup

How it works

- Collect: new feedback starts the scenario, which updates the customer's record and reads their complaint history.
- Score: ChatGPT rates sentiment and severity, and flags when it is unsure.
- Route: the router picks one of five routes from the score and the customer's history (see diagram).
- Act and report: every route logs the feedback and updates the dashboard; both negative routes email the manager.

Result

In testing, each piece of feedback was scored, routed and reported in 11 seconds. The dashboard showed feedback by branch, average sentiment and severity, and where every item was sent.

BUSINESS VALUE

- **Customers kept.** Urgent complaints reach a manager in seconds, before the customer walks away.
- **More reviews.** Happy customers' feedback is queued to post as reviews that win new business.
- **Clear oversight.** Managers compare branches at a glance and act where it matters most.

ALSO WORKS FOR

Any business that collects reviews, surveys or support messages, including restaurants, salons, garages, retailers and service companies.

Management Dashboard

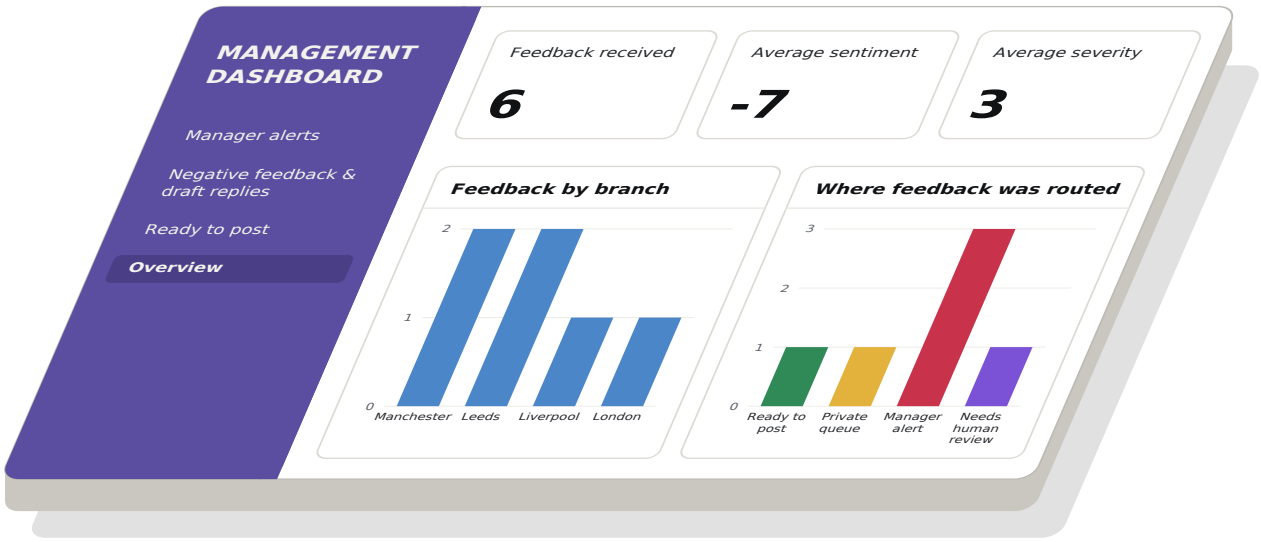

Where managers see the results of the Make scenario | Hosted on Airtable

What it is

Every route in the Make scenario creates a record in this dashboard, so managers see all feedback across the four branches in one place, already scored and sorted, without opening a spreadsheet.

The dashboard

3D VIEW OF THE MANAGEMENT DASHBOARD · FIGURES FROM A TEST RUN

What managers see

- Headline figures: how much feedback has come in, plus the average sentiment and severity scores from ChatGPT.
- Feedback by branch, so Manchester, Leeds, Liverpool and London can be compared at a glance.
- Where feedback was routed: ready to post, private queue, manager alert or needs human review.
- Separate pages for manager alerts, negative feedback with AI-drafted replies, and positive feedback ready to post.

Why it matters

Managers act on what matters first. Urgent complaints surface as alerts, negative feedback arrives with a draft reply ready to send, and good reviews are queued for posting, all without anyone reading every comment.
