Job Application Tracker

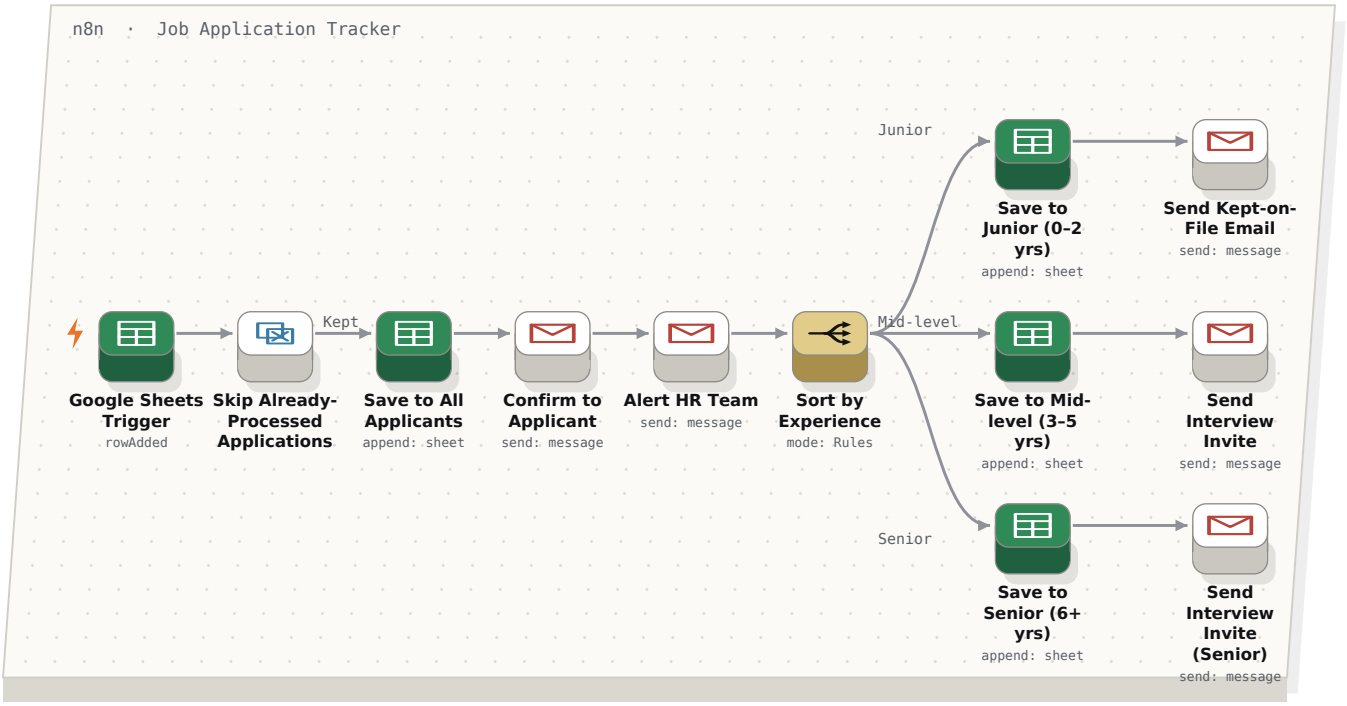

n8n workflow that confirms, logs and sorts every application | Jesse Chukwuka Agu

The problem

Every application has to be logged, acknowledged and passed to HR, then sorted by experience before the right reply goes out. Done by hand, that is slow, inconsistent and easy to get wrong.

The setup

3D VIEW OF THE n8n WORKFLOW · 12 NODES

How it works

- A new application row in Google Sheets triggers the workflow. Rows already processed are skipped, so nobody gets two emails.
- Every applicant is saved to an All Applicants sheet and gets a confirmation email, and HR is alerted straight away.
- A rules-based switch sorts applicants by experience: Junior (0–2 yrs), Mid-level (3–5 yrs) or Senior (6+ yrs).
- Each level is saved to its own sheet. Junior applicants get a kept-on-file email; mid-level and senior applicants get an interview invite.

Testing and result

I tested one application per experience level and confirmed each was logged, confirmed, flagged to HR, filed to the right sheet and sent the right email. I then reran all three tests live while presenting at TS Academy.

Customer Feedback Automation

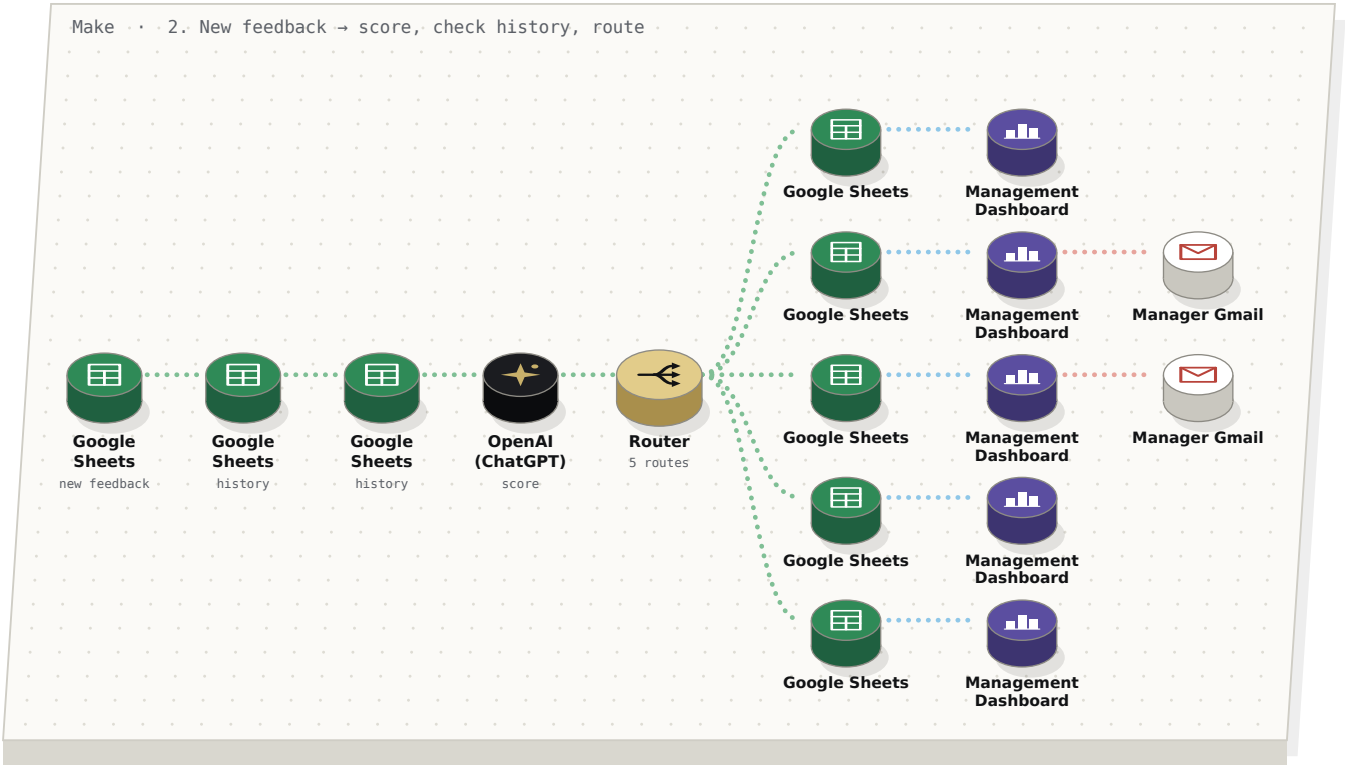

Make scenario: new feedback → score, check history, route | Team project

The problem

A car care chain with branches in Manchester, Leeds, Liverpool and London gets feedback it can't review fast enough. Urgent complaints wait, and managers have no single view of how each branch is doing.

The setup

3D VIEW OF THE MAKE SCENARIO · 5 ROUTES

How it works

- New feedback in Google Sheets starts the scenario, which then checks the customer's history.
- ChatGPT scores each piece of feedback for sentiment and severity.
- A router sends it down one of five routes, such as ready to post, private queue, manager alert or needs human review.
- Every route logs to Google Sheets and the Management Dashboard. Urgent routes also email the manager.

Result

A successful test run finished in 11 seconds (13 operations). The dashboard showed 6 pieces of feedback across 4 branches, average sentiment and severity, and where each was routed, with pages for manager alerts, negative feedback with draft replies, and posts ready to publish.

Management Dashboard

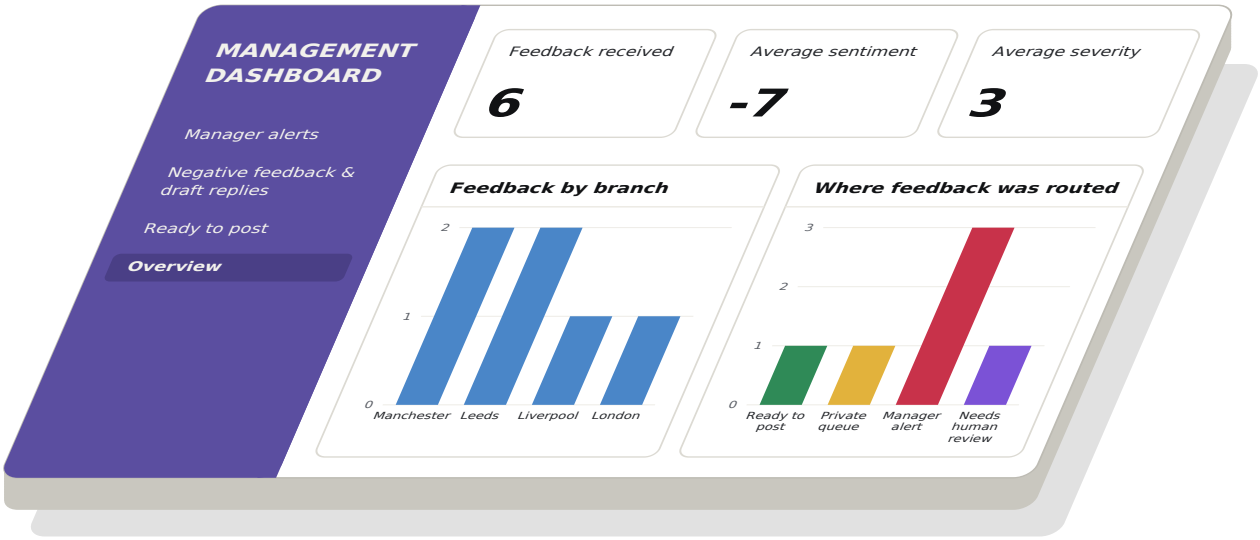

Where managers see the results of the Make scenario | Hosted on Airtable

What it is

Every route in the Make scenario creates a record in this dashboard, so managers see all feedback across the four branches in one place, already scored and sorted, without opening a spreadsheet.

The dashboard

3D VIEW OF THE MANAGEMENT DASHBOARD · FIGURES FROM A TEST RUN

What managers see

- Headline figures: how much feedback has come in, plus the average sentiment and severity scores from ChatGPT.
- Feedback by branch, so Manchester, Leeds, Liverpool and London can be compared at a glance.
- Where feedback was routed: ready to post, private queue, manager alert or needs human review.
- Separate pages for manager alerts, negative feedback with AI-drafted replies, and positive feedback ready to post.

Why it matters

Managers act on what matters first. Urgent complaints surface as alerts, negative feedback arrives with a draft reply ready to send, and good reviews are queued for posting, all without anyone reading every comment.
